

## Automatic announcement system SimpleVOX

The SimpleVOX public voice notification and information system is intended to inform listeners (visitors, employees, passengers etc.) about key events in area. Playback of predefined announcements can be initiated manually from graphic interface or automatically based on events in the SimpleVOX control system. The SimpleVOX control system is typically connected with clients internal information systems. The announcements can be delivered using existing public audio system.

The SimpleVOX system offers exceptional quality of audio output. Recording and editing of each notification or announcement segment is done by professional narrators, announcers and acoustic professionals. In this way natural sound of announcements is guaranteed. Listeners then perceive the notification as fluent and uninterrupted in given language. Notification and announcement libraries are individually adjusted for acoustic conditions in target area. In this way all negative effects such as echo, reverberation or distortion of acoustic signal are suppressed.

---

### Main features

- Fully automated or semi-automated operation when integrated with information systems
- Modular architecture allows to install only modules that are really needed
- High availability clustering solution
- Professional connection to currently existing public audio system with high quality of audio
- Customization of audio libraries for acoustic characteristics of target area

### Advantages of SimpleVOX system

- Open logic makes generation of highly complex announcements in real time possible. Each announcement is automatically created from individual parts (announcements, flight numbers, company names, building numbers etc.)
- System can operate without operator in fully automated mode, even in critical situations
- High clarity and voice intelligibility compared with classic manual announcement system, where intelligibility is based on the individual qualities of announcer
- Personnel cost savings – announcer is not needed
- Highly modular and expandable system

---

### Price and licensing conditions

Price of the SimpleVOX system is based on individual needs of each customer.

Due to high modularity of SimpleVOX system, customer pays only for those parts of system he needs. Final price is than highly influenced by interoperability with current information systems, parameters of reliability and accessibility of system, service contract, number of segments in voice library and number of languages. Part of implementation is also adjusting voice library to acoustic conditions in area where announcements will be played.
